

Memory Disorders Clinic

The Memory Disorders Clinic is a clinic of specialists in Neurology, Neuropsychology, and Research. The clinic provides a diagnostic work-up for people experiencing memory problems. The memory disorders clinic is part of the Department of Neurology at the Medical College of Georgia in Augusta, GA. It is located at 2834 Hillcreek Drive.

Patients who come to the clinic are seen by a team of professionals. They are first seen by the **neurologist**, Dr. Suzanne Smith, who performs the initial assessment. Patients then have **neuropsychological** testing to determine the extent of their memory problems. The testing will also tell whether the patients may have other underlying medical conditions such as depression.

Patients who are exhibiting behavioral problems, such as outbursts of anger, may also be seen by a **psychiatrist**. While the patients are undergoing the testing, information from the **local chapter** of the Alzheimer's Association is made available to the family to inform them of local resources.

The families also have the opportunity to enroll in **research** projects. Dr. Poduslo is doing genetic studies on Alzheimer's disease and other neurological diseases.

Once the patient testing is finished, Dr. Smith meets with the family again and recommends additional blood work or MRI scans that may need to be done. Then a **return visit** is scheduled to go over the results and prescribe medications, if needed.

Referrals: Patients may be self referred or referred by a physician.

Who should come: Patients having serious memory problems should visit the clinic. It is recommended that if a patient has had blood work or CT/MRI scans of the brain in the past year, the results should be brought on the first visit. Also a list of all medications is helpful to the physicians.

The clinic is a **unique opportunity** for patients in the surrounding area to have a **complete evaluation** for their memory disorders and for the families to have **counseling** and be informed about local resources and research.

Ten warning signs of Alzheimer's disease: memory loss; difficulty with familiar tasks; problems with language; disorientation; poor judgment; problems with abstract thinking; misplacing things; changes in mood or behavior; changes in personality; loss of initiative. (Taken from the National Alzheimer's Association).
